

Matrix – the extendable platform for an agile business

In common with ERP systems, Matrix uses a Common Data Model which underpins the ability to deploy multiple applications for multiple workflows or processes across your entire organisation – all from a single integrated common data platform.

Extending the benefits of the platform across your business

Businesses have a wide scope of applications and processes across teams and departments – the Matrix Platform will enable your organisation to bring together all vital applications under one singular workspace.

This means that as well as the integration of additional SDSL applications and modules; we can extend the Platform to integrate with your other key business applications or tools.

Client specific extension

The Matrix platform can be customised to integrate with other applications currently used within your organisation. Thus enabling tight integration across teams and business units to ensure that all processes are incorporated within a single workspace enterprise wide.

Your client-specific extension can be integration with bespoke software currently used within your organisation or through specific new modules created by SDSL with functionality entirely tailored to your specific commercial requirement.

Integration with common enterprise software

The design approach to Matrix also enables the Platform to extend to commonly available business software. Enabling Matrix to deliver information-agility and productivity benefits cross-functionally and enterprise wide.

Working with you to extend Matrix across your entire workflow

Our Professional Services Department will work with you either as part of your Matrix Deployment Process or as a separate engagement to explore how Matrix can be extended into additional areas of your organisational workflow.

For more information on how your organisation can benefit from the Matrix Platform please contact your Account Manager or sales@sdsd.com
